ICA-0-3

Melanoma, NOS 8720/3

Site: subcutaneous tissue, abdomen

C49.4

Patient ID - Sample

hw 1/7/12

**(A) ABDOMEN, SKIN ELLIPSE:**

**MULTINODULAR MALIGNANT EPITHELIOID NEOPLASM, CONSISTENT WITH MELANOMA, INVOLVING DERMIS AND FIBROADIPOSE TISSUE.**

**THE LARGEST TUMOR FOCUS MEASURES 80.0 X 30.0 MM (AS PER GROSS ASSESSMENT) AND HAS INFILTRATIVE BORDERS.**

**Tumor necrosis is seen.**

**Margins of resection have been evaluated and appear free of tumor.**

**Four lymph nodes, no tumor present (0/4).**

**(See comment)**

**(B) LEFT ILIAC AND OBTURATOR NODES, LYMPHADENECTOMY:**

**Twelve lymph nodes, no tumor present (0/12).**

**(C) LEFT NODE ADJACENT TO EPIGASTRIC VESSEL, LYMPHADENECTOMY:**

**Two lymph nodes, no tumor present (0/2).**

**COMMENT**

(A) The tumor is composed of epithelioid cells with marked pleomorphism. The tumor is present in dermis and subcutaneous tissue. Some of the tumoral nodules might represent completely replaced by tumor lymph nodes.

No intracytoplasmic pigment is identified within the tumor cells. See also
