# COMMENT

The morphological features of this neoplasm are those of a relatively low-grade (i.e., grade I-II) invasive, keratinizing squamous carcinoma. Tumor invades underlying submucosal connective tissue, superficial muscle and deep muscle. Tumor forms an ulcerated 2.5 x 2.0 cm mass that invades to a depth of approximately 1.5 cm. Peri-neural invasion is present. There are morphological features strongly suggestive of lympho-vascular invasion by tumor. The final resection margins are free of tumor.
