

Diagnosis (diagnoses):

Resected colon sample with a centrally ulcerated, moderately differentiated adenocarcinoma of the colorectal type, measuring a max of 4.8 cm in diameter, with broad infiltration of the pericolic fatty tissue and two local lymph node metastases immediately next to the tumor. Tumor-free colon resection margins. Tumor-free mesenteric resection margin. Otherwise, individual tubular adenomas of the colon mucous membrane with predominant moderate dysplasia (synonym: mild intraepithelial neoplasia).

The tumor stage is: pT2, pN0 (0/27) pMX; G2, L0, V0, R0
