## SURGICAL PATHOLOGY REPORT

## DIAGNOSIS

## DIAGNOSIS:

Right breast modified radical mastectomy.  
Two areas of invasive lobular carcinoma.  
Sizes: 2.8 and 1.8 cm.  
Architectural score: 3 of 3.  
Nuclear score: 2 of 3.  
Mitotic score: 1 of 3.  
Total score: 6 of 9.  
Grade 2.  
Extensive lobular carcinoma in situ present.  
No evidence of angiolymphatic invasion.  
No evidence of skin and nipple involvement.  
Prognostic was previously performed and will not be repeated unless requested.  
Deep margin of excision is involved by carcinoma.

Attached axillary lymph node: One lymph node, metastatic carcinoma present.  
Size: 0.4 cm.  
No evidence of extracapsular extension.

TMN: T2pN1

ICD-O-3  
Carcinoma, infiltrating  
Lobular NOS 8520/3

## CLINICAL INFORMATION

## CLINICAL HISTORY:

Preoperative Diagnosis: Right modified radical mastectomy with sentinel node mapping with frozen section. Invasive lobular carcinoma. ER positive, PR positive, Her-2 negative.

## Postoperative Diagnosis:

Symptoms/Radiologic Findings:

## SPECIMENS:

Right breast

## SPECIMEN DATA

## GROSS DESCRIPTION:

The specimen is received in formalin labeled with the patient's name [REDACTED] right breast. The specimen consists of a portion of fibroadipose breast tissue and overlying skin measuring 20.0 x 15.0 x 6.0 cm and weighs 446 grams. The skin surface measures 15.0 x 10.5 cm and is light tan wrinkled. There is slight puckering of the skin surface noted that measures 2.0 cm that is 8.5 cm from the nipple. The nipple is eccentrically placed and appears grossly unremarkable. There is no orientation given to the specimen. The deep margin is inked. Sectioning reveals gray-tan mass measuring 1.8 x 1.5 x 1.5 cm that is 0.1 cm from the deep margin. It is located at the periphery of the breast. A second mass measuring 2.8 x 2.5 x 2.5 cm that is 0.1 cm from the deep margin, 0.2 cm from the skin surface, corresponds to the puckered area noted previously mentioned on the skin surface. The surrounding tissue reveals yellow-tan fatty fibroadipose tissue predominantly with areas of gray fibrous tissue. No other lesions are identified. On the periphery of the breast, there is a gray-tan nodule possible lymph node measuring 2.0 x 1.0 x 1.0 cm. Received with the specimen are three cassettes, one green, one yellow, one blue labeled [REDACTED] representative sections are submitted in cassettes labeled 1 follows: nipple, block 1; sections from the first lesion in blocks 2 through 5; sections from the second lesion in blocks 6 through 9; possible lymph node sectioned in total in blocks 10 through 12; random sections from all four quadrants in blocks 13 through 16.
